pool water care made easy

Algae Prevention Tips

PREVENTION TIP	REASON WHY	Recommended product/s
Brush and vacuum pool walls and floor	<ul style="list-style-type: none"> - This will bring the surface clinging algae into suspension and allow the sanitiser and algacide to work - Nutrients that algae can feed on will be more effectively removed 	
Maintain correct pH levels	<ul style="list-style-type: none"> - This will ensure the sanitiser is working more efficiently. A high pH level will greatly reduce how efficiently chlorine works - Algae spores multiply more rapidly at a high pH 	 <p>Blue Horizons pH Minus</p>
Monitor sanitiser levels	<ul style="list-style-type: none"> - Maintaining sanitiser levels within the recommended range of 1 – 3mg/l (free chlorine), 2 – 4 mg/l (bromine) will help prevent algae growth - Algae will multiply more rapidly at low sanitiser levels 	 <p>Blue Horizons Sanitisers</p>
Oxidise your pool regularly	<ul style="list-style-type: none"> - As waste compounds build-up in your swimming pool they can become a source of food for algae growth - Oxidising your pool regularly will reduce the likelihood of algae growth 	 <p>Blue Horizons Pool Fusion</p>
Remove phosphates if levels are high (above 0.3mg/l)	<ul style="list-style-type: none"> - Phosphates are a 'food' source for algae growth in swimming pool water - Phosphates may be present in your mains water or enter your pool via garden run-off or surrounding agricultural land - Removing phosphates will greatly reduce the likelihood of algae growth in your pool 	 <p>Blue Horizons Phos Away</p>
